The most significant pain and disability results when large pieces of bone are harvested from the front. New techniques have been developed for harvesting graft through smaller incisions in an attempt to decrease donor site pain. Minimizing the amount of soft tissue trauma and the use of local anesthetics in bone graft harvest helps to decrease post-operative pain.

Autologous bone grafts harvested from the iliac crest are commonly used in reconstructive orthopaedic surgery. Autologous bone is used to help promote bone healing in fractures and to provide structural support for reconstructive surgery.

Complications of Iliac Crest Bone Graft Harvesting ...

Grafted autogenous bone heals into growing bone through all three modes of bone formation; these stages are not separate and distinct, but rather overlap each other. 3 Common areas from which autogenous bone can be harvested include extraoral sites such as the iliac crest or tibial plateau and intraoral sites such as the mandibular symphysis, maxillary tuberosity, ramus, or exostoses. 3, 8, 9 Less resorption has been associated with the use of mandibular bone grafts than with iliac crest ...
