Psychoeducation is an important component of management of depression in children and adolescents. It not only helps the patients and their families, but also helps the clinician. Psychoeducation makes the patient and family members informed partners in the decision-making and also enhances the treatment adherence.

Clinical management of nocturnal enuresis. Alarm therapy and the use of desmopressin have been shown to be effective in randomized trials. Children with NMEN first need treatment of the underlying daytime functional bladder problem before treatment of nocturnal enuresis. In patients with findings of overactive bladder, besides urotherapy, anticholinergic drugs may be useful.
