Enhancing The Role Of Cancer

Mutations occurring in cancer often misregulate enhancers that normally control the signal-dependent expression of growth-related genes. This misregulation can result from trans-acting mechanisms, such as activation of the transcription factors or epigenetic regulators that control enhancer activity,...

Pathological hypoxia affects both cancer cells and the tumor microenvironment, and plays a pivotal role in the process of cancer progression and dissemination. Hypoxia regulates tumor neovascularization, metabolism, cell survival, and cell death.

FRK plays an oncogenic role in lung cancer cells via a novel regulation mechanism of enhancing the stemness of H1299 cells by inducing metabolism reprogramming, which finally promotes EMT and metastasis. Our study also indicates that FRK could be used as a potential therapeutic target for drug development.

Based on our evidence that (–)-epicatechin (EC), an inert catechin, enhances the cancer-preventive activity of green tea catechins, we studied the enhancing effects of EC on inductions of growth inhibition and apoptosis in human lung cancer cell lines PC-9 and A549 with curcumin.

NK cells play an important role in the immune surveillance of cancer and are accomplished to prevent the growth of tumor , . They have the ability to recognize targets directly through inhibitory or activating receptors expressed on the cell surface of tumor or other target cells [11] .

The field has produced several new methods of treating cancer, called immunotherapies, that increase the strength of immune responses against tumors. Immunotherapies either stimulate the activities of specific components of the immune system or counteract signals produced by cancer cells that suppress immune responses.

Posttranslational modifications of histones, for example, may play a crucial role in cancer development and progression by modulating gene transcription, chromatin remodeling, and nuclear architecture.

Although nurse practitioners have traditionally worked in primary care and specific areas of secondary care such as A&E, there is a huge opportunity to develop roles in cancer care. At The Royal Marsden, the role is being developed to work in the transitional care unit (TCU).

Vitamin D and its metabolites reduce the incidence of many types of cancer by inhibiting tumor angiogenesis,^{182 - 185} stimulating mutual adherence of cells,¹⁸⁶ and enhancing intercellular communication through gap junctions,¹⁸⁷ thereby strengthening the inhibition of proliferation that results from tight physical contact with adjacent cells within a tissue (contact inhibition).

With increased effectiveness of medical treatment for cancer, greater attention has been directed to the quality of life of cancer patients and cancer survivors. Work on this topic is aimed at better understanding the determinants of quality of life and creating ways to optimize these outcomes. Insights from many disciplines inform this effort.

It is becoming increasingly clear that Treg cells play an active and significant role in the progression of cancer, and have an important role in suppressing tumor-specific immunity. Thus, there is a clear rationale for developing clinical strategies to diminish their regulatory influences, with the ultimate goal of augmenting antitumor immunity.
