Thyroid hormones are two hormones produced and released by the thyroid gland, namely triiodothyronine (T₃) and thyroxine (T₄). They are tyrosine-based hormones that are primarily responsible for regulation of metabolism. T₃ and T₄ are partially composed of iodine. A deficiency of iodine leads to decreased production of T₃ and T₄, enlarges the

circulatory system, regulating distant target organs. In humans, the major endocrine glands are the thyroid gland and the adrenal glands. In vertebrates, the hypothalamus is the neural control center for all endocrine systems.

Endocrine system - Wikipedia

Hormones are also regulated by receptor

Acces PDF Hormones From Molecules To Disease

agonists. Hormones are ligands, which are any kinds of molecules that produce a signal by binding to a receptor site on a protein. Hormone effects can be inhibited, thus regulated, by competing ligands that bind to the same target receptor as the hormone in question.

Hormone - Wikipedia

Acces PDF Hormones From Molecules To Disease

The thyroid gland is the first endocrine gland to develop in the embryo and begins to form about 24 days after fertilization. Like Rathke's pouch, that develops into the anterior pituitary gland (see Box 7.2), the thyroid gland also develops from an outgrowth of the pharyngeal endoderm. As the embryo grows the thyroid gland descends into
