Generally speaking, projectile motion problems involve objects that are thrown, shot, or dropped. Usually the object will be launched directly upward or dropped directly down. Consider the following example: An object is launched directly upward at 19.6 m/s from a 58.8-meter tall platform.

### Quadratic Application: Projectile Motion

This is always true for these up/down projectile motion problems. (If you have an exercise with sideways motion, the equation will have a different form, but they'll always give you that equation.) The initial velocity is the coefficient for the middle term, and the initial height is the constant term.

18. When explaining why his rocket did not set the fire, Homer used the formula  $s = at^2 + vt + d$ . a. What do the letters S, a, and t stand for in this equation?  $S = \underline{\hspace{1cm}}$   $a = \underline{\hspace{1cm}}$   $t = \underline{\hspace{1cm}}$  b. This equation could also be written as  $d = 16t^2$ , where d is the distance, in feet, that an object falls due to gravity as a function of time, t, in seconds.

**Projectile Motion** An object is thrown straight up from the top of a building  $h$  feet tall with an initial velocity of  $v$  feet per second. The height of the object as a function of time can be modeled by the function  $h(t) = -16t^2 + vt + h$ , where  $h(t)$  is the height of the object (in feet)  $t$  seconds after it is thrown.
