Such nets can also be seen as point-to-set mappings, where X is a directed set. Through appropriate generalizations, several basic continuity notions and results, and therefore quite a bit of general topology, can be extended both to nets of sets and to point-to-set mappings, taking into account the topological properties of X

In mathematics, a multivalued function is similar to a function, but may associate several values to each input. More precisely, a multivalued function from a domain X to a codomain Y associates to each x in X one or more values y in Y ; it is thus a left-total binary relation. [citation needed] Some authors allow a multivalued function to have no value for some inputs (in this case a ...

We present new results regarding fixed point sets of various set-valued mappings using the concept of fixed point iteration schemes and the newly defined concept of fixed point resolutions. In particular, we prove that the fixed point sets of certain nonexpansive set-valued mappings are contractible.
