## **CHAPTER 1 - PROBLEM SOLUTIONS**

Stress is the expression of force applied to a unit area of surface. It is measured in psi (English unit) or in MPa (SI unit). Another unit of stress which is not commonly used is the dynes (cgs unit). Stress is the ratio of force over area.

The solution was given for plates subjected to sinusoidal transverse loads under plane-strain conditions.

Recall from class that the Airy stress function, is a solution to the biharmonic equation  $\nabla^4 \phi = 0$ . In polar coordinates, the biharmonic operator corresponds to  $r^4 \nabla^4$  or  $\nabla^2 (r^2 \nabla^2)$ . For an axisymmetric problem, the general form of the Airy stress function is  $a_3 r^2 \log r$ .
