### Thermal Quantum Field Theory Algebraic

This monograph presents recent developments in quantum field theory at finite temperature. By using Lie groups, ideas from thermal theory are considered with concepts of symmetry, allowing for applications not only to quantum field theory but also to transport theory, quantum optics and statistical mechanics.

Abstract: In this paper we compare the construction of equilibrium states at finite temperature for self-interacting massive scalar quantum field theories on Minkowski spacetime proposed by Fredenhagen and Lindner with results obtained in ordinary thermal field theory, by means of real time and Matsubara formalisms. In the construction of this state, even if the adiabatic limit is considered, the interaction Lagrangian is multiplied by a smooth time cut-off.

1 Introduction: Why Thermal Field Theory? The conventional quantum eld theory is formalized at zero temperature. The the-oretical predictions under this framework, for example the cross sections of particle collisions in an accelerator, are extremely good to match experimental data. However,

### An Introduction to Thermal Field Theory

Thermal quantum field theory. In theoretical physics, thermal quantum field theory ( thermal field theory for short) or finite temperature field theory

is a set of methods to calculate expectation values of physical observables of a quantum field theory at finite temperature . In the Matsubara formalism,...

A new formalism for the perturbative construction of algebraic quantum field theory is developed. The formalism allows the treatment of low dimensional theories and of non-polynomial interactions.

A resume of recent trends in thermal field theory is presented with emphasis on algebraic aspects. In this sense, some representations of Lie symmetries provide, in particular, a unified axiomatization, via the so-called thermofield dynamics (TFD) approach, of different methods treating thermal systems.

The idea of algebraic formulations of quantum theory, which we describe in Section 2, can be traced back to Heisenberg's matrix mechanics, in which the algebraic relations between observables are the primary data. Schrödinger's wave mechanics, by contrast, starts with spaces of

Abstract. We compare the construction of equilibrium states at finite temperature for self-interacting massive scalar quantum field theories on Minkowski spacetime proposed by Fredenhagen and Lindner (Commun Math Phys 332:895, 2014) with results obtained in ordinary thermal field theory, by means of real-time and Matsubara (or imaginary time) formalisms.

2) algebraic quantum field theory by means of local nets of  $C^*$ -algebras of observables. This is the approach predominant in mathematical physics. It produces the structural theorems of quantum field theory, such as the PCT theorem and the spin-statistics theorem and it seamlessly generalizes to QFT on curved spacetimes.

Idea. What is called locally covariant perturbative algebraic quantum field theory (Brunetti-Fredenhagen 00, Brunetti-Fredenhagen-Verch 03) is a formulation of local perturbative quantum field theory on general spacetimes (hence on general classical background field configurations of the field theory of gravity) which is both mathematically rigorous as well as closely connected to the ...
